ATI Course Project 2026 - Scoring & Submission Guide

This guide applies to all four project tracks. Your project brief is a separate document.

Project Tracks

#	Track	Modality
1	GVLiD - Robust Grapevine Disease Recognition	Image
2	ViGoEmotions - Fine-Grained Multi-Label Vietnamese Emotion Recognition	Text
3	DataSEC - Environmental Sound Classification under Noise	Audio
4	DefectAtlas-20 - Cross-Material Surface-Defect Recognition	Image

Each group works on one assigned track throughout the semester.

Grading Weights

Component	Weight	What it measures
Attendance	10%	Class attendance and tutorial participation.
Midterm	30%	Presentation, dataset understanding, preprocessing, baseline modeling, and error analysis.
Final	60%	Paper-style report, viva, research-question experiments, reproducibility.

Attendance - 10%

- Lecture attendance: 8 points.
- Tutorial participation: 2 points (active work during sessions, question engagement, checkpoint completion).

Midterm - 30%

A presentation-based checkpoint. Demonstrate dataset understanding and valid baseline experiments.

Expected evidence:

- dataset description and access protocol;
- exploratory data analysis with task-appropriate statistics;
- train / validation / test split and justification;
- preprocessing pipeline;
- baseline or pretrained model results;
- correct metrics for the task;
- result tables and at least one error-analysis view;
- proposed Final research question.

A clean, correct baseline study is better than many poorly controlled experiments.

Final - 60%

A paper-style report and viva. Must go beyond the Midterm and answer research questions with controlled experiments.

Expected evidence:

- paper-style report (abstract, introduction, data, method, experiments, results, discussion, limitations, conclusion);
- viva defense of design decisions and results;
- controlled experiments designed to answer the required research question;
- prediction-level outputs or saved probabilities;
- tables and figures generated from code;
- reproducible notebook or code with a clear README;
- explicit limitations and failure-case analysis.

Your Final grade depends on whether your experiments actually answer the research question, not only on whether a model achieves a high score.

Submission Package

Submit a repository or archive containing:

- report as PDF;
- presentation slides (if requested);
- executable notebook or code;
- README with setup and run instructions;
- fixed split IDs or scripts that reproduce the same split;
- configuration files or clearly documented hyperparameters;
- generated result tables and figures;
- prediction-level CSV or saved probabilities (required by each brief);
- note listing hardware, package versions, and random seeds.

Do not submit raw restricted datasets unless the dataset license explicitly permits redistribution.

Academic Integrity

- Follow the license and terms of each dataset.
- Do not upload restricted raw data to public repositories.
- Do not tune models on the test set.
- Do not report results that cannot be reproduced from submitted code.
- Do not fabricate experiments, metrics, figures, or failure examples.
- Cite all pretrained models, papers, datasets, and code you use.

What Strong Projects Show

- A simple but valid experimental design.
- Clean split discipline (no test-set leakage).
- Task-appropriate metrics reported correctly.
- Comparison across models or protocols.
- Thoughtful failure analysis.
- Reproducible result generation.
- A clear, evidence-backed answer to at least one research question.
- Honest limitations instead of overclaiming.
